3: Krige E-5 (1928-1938)1938 FX14 Lovedu FX14

in effective check the tendency for people to move away after every quarrel or accusation of witchcraft, villages were not only appreciably larger than to-day but also somewhat differently arranged, with both courtyard and cattle-kraal in the centre. Wherever possible the Sotho build on mountains, which are covered with a rich, loamy soil well suited to cultivation, are less fever-ridden than the valleys, and in the old days afforded better protection against enemies. Indeed, it is not until recent times that the valleys have been opened up even for agriculture. Within the village each married woman generally has two huts, kitchen- and sleeping-hut, while one or more fenced-in sections near the hedge are devoted to the storage of mealies on the cob and beer-making activities.

TRIBAL ECONOMY. The tribes of the Lowveld are predominantly agricultural, possessing on the whole few cattle. Milk, which many adults find nauseating, plays a very minor part in their diet, milk taboos are unknown while the meat sacrifice is rare, beer taking its place. As among Venda and the Sotho of the Highveld, women are not as strictly excluded from contact with cattle as among the Nguni; not only is it common for girls to herd cattle in the absence of boys in town or at the circumcision school, but many women also possess cattle in their own right. While it would be impossible here to give a full account of Lowveld agriculture, it is of interest to enumerate some of its more salient aspects. Men take a considerable part in agricultural activities, every married man having one large field for which he is responsible. But while women plant every kind of crop, men grow and reap only mealies, grain crops, and sugar-cane; pumpkins, beans, ground- and monkey-nuts, &c., are considered as purely a woman's concern. In our area, as elsewhere, these crops are mostly planted together in the same field, mealies predominating in some parts, kaffir-corn or millet being the chief crop in others. Partly as a result of congestion and partly in order to take advantage of differential climatic conditions as between mountain and valley, fields of any one family are generally very widely scattered, being sometimes as much as ten miles apart. Recognition of the food value of various wild fruit trees, such as the morula and wild fig, is shown by the fines attached to cutting them without special permission. An interesting feature
